Regularities in the Formation and Distribution of Endogenous
Mineral Resource Deposits,
The Third All-Union Conference on...

S/011/63/000/001/002/002
A006/A101

Group 2 included reports on--
endogenous deposits in other synclinal regions, such as mercury formations in
Siberia and the Far East (V. A. Kuznetsov), pyrite deposits in the Ural (S. N. Ivanov), Kimeridgian and Alpine metallogeny in Uzbekistan (I. Kh. Khamrabayev);
ore region types in the Pacific area (Ye. A. Radkevich); metallogeny in Tadzhikistan (K. I. Litvinenko); hydrothermally transformed rocks in the Trans-Carpathian region (M. Yu. Fishkin) peculiarities in magmatism and metallogeny of the Mountaneous Crimea (V. I. Lebedinskiy), antimony-mercury fields (M. A. Karasik) and others. Group 3 included reports on the classification of metallogenous zones and provinces of the Earth crust (D. I. Gorzhavskiy); classification of metallogenous zone types of the Earth crust (V. N. Kozarenko); classification of magmatogenous non-metallic mineral resources as a basis of prognoses and prospecting (V. P. Petrov); types of metallogenous provinces in synclinal regions of the USSR (A. I. Semenov); principles of geological zoning on the example of Central Asia (K. L. Babayev); comparative characteristics of metallogeny in Malyy Caucasus and the Kamchatka-Koryak zone (I. G. Magak'yan), some particularities of metallogeny in the Mediterranean geosynclinal region (O. A. Tvalchrelidze); rootless plutons and some peculiarities in the magmatism of moving zones (A. P. Lebedev); paragenetic ore complexes (P. S. Saakyan) the part of deep-lying breaks in metallogeny of syncline regions on the example of the Caucasus (E. Sh. Shikhalibeyli). The closing report was read by A. V. Sidorenko, Minister of Geology and Preservation of Mineral Resources of the USSR.

REPLACEMENT OF DEFECTS OF THE FOREARM BONES (Russian text)
- Fishkin V. I. - ORTOP. TRAVM. I PROTEZ. 1957, 4 (58-59)
It is suggested to employ a graft taken from the lateral surface of the iliac bone
and formed in the shape of a butterfly. The centre part of the graft is placed be-
tween the fragments of the bone, and the lateral parts are applied to the lateral
surface of the fragments. The 'butterfly' is fixed by an intramedullary metal pin.

Title : Morphological Changes in ~~the~~ Nerve Fibers and
Their Endings in the Somatic Musculature Athetosis.

Orig Pub: Arkhiv patologii, 1957, 19, No 6, 29-35.

Abstract: A histological study was made of 43 muscles of
13 patients having athetosis and 7 having spastic
hyperkinosis and hemiathetosis. In intramuscular
nerve trunks, varicose thickenings and vacuoliz-
ation of the nerve fibers were shown. In the
motor nerve endings thickening and hardening of
the terminal nerve branches, the "phenomenon
of the spheres", and more rarely "neuromas of

Abstract: motor endings are observed. Simultaneously with the changes in the neurofibrillar apparatus, a multiplication occurs of the nuclei of the foot of the motor ending. In the neuro-muscular spindles, a hardening and swelling of the terminal branchings of the sensory endings is noted, and the appearance on them of large irregular forms of swellings. A thickening of the capsule of the neuro-muscular spindle, and an increase in the lymphatic space takes place. The majority of the changes shown in athetosis pertain to the group "phenomena of excitation". In striated muscular tissue dystrophic and atrophic changes are observed.

TITLE: Accretion process characteristics of bone transplants² free and on feeding muscular pedicles

CITED SOURCE: Ortopediya, travmatol. i protezir., no. 4, 1964, 22-24

TOPIC TAGS: dog, transplantation, bone graft, accretion, femur, vascularization

TRANSLATION: The behavior of free transplants and feeding transplants was compared in experiments on 17 dogs with replantation of the femur greater trochanter. The external wide muscle of the femur, from which arterial branches enter the greater trochanter, according to the authors, served as a feeding pedicle. A skelitized major trochanter from the opposite side served as a control for the feeding transplants. Postoperative observation periods were 7, 14, 21 days and 1, 2, 4, 6 and 12 mos. Due to preservation of the basic vascular

TITLE: Electric Slag Welding for the Repair of Equipment (Elektro-shlakovaya svarka pri remonte oborudovaniya)

PERIODICAL: Avtomaticheskaya svarka, 1958,¹¹Nr 7, pp 76-81 (USSR)

ABSTRACT: The application of electric slag welding process for the repair of heavy equipment is described on three examples of repair carried out at the Moscow Automobile Plant imeni Likhachev: 1) frame of press-shears; 2) a large press crankshaft; 3) a die-support plate of a press. The welding of the ends to the crankshaft was carried out under the guidance of Candidate of Technical Sciences G.Z. Voloshkevich. Information is described in detail and illustrated by photographs and diagrams. There are 2 photos, 2 diagrams and 1 table.

TITLE: Measuring of Deformation and Stress at the Welding of Elements with great Thickness made of St. 3

PERIODICAL: Avtomaticheskaya svarka, 1959, Vol 12, Nr 6 (75)
pp 22-27 (USSR)

ABSTRACT: The article presents the description of experiments on the definition of quantity and character of residual stress in steel-samples of great thickness, welded the "electric slag" way. The experiments were made by the welding laboratory of MVTU imeni Baumann, together with the Moscow automobile plant imeni Likhachev. The experiments were made to study: 1) The development of deformations in large size welded joints in course of time, 2) The field of residual stress in butt welds of elements with great thickness, 3) The taking down of residual stress by heat treatment. The deformations in course of time were produced by a mechanical press

Card 1/3

SOV/125-12-6-3/14

Measuring of Deformation and Stress at the Welding of Elements
with great Thickness made of St.3

with a strength of 3.5 thousand tons (fig. 1 and 2). The material of all samples was a low carbon steel of type M St 3 with following chemical compounds: 0.14-0.22% C, 0.40-0.65% Mn, 0.12-0.30% Si, not more than 0.055% S and less than 0.05% P. The mechanical qualities of the steel were: $\sigma_k = 38-41 \text{ Kg/mm}^2$, $\sigma_T = 24 \text{ kg/mm}^2$ and $\delta = 27\%$. The experimental investigation of triaxial stress showed, that the theoretical calculation (Ref. 2) does not correspond with the results of the experiment. A deformation along the welds in not loaded constructions, made of elements of great thickness, during a considerable length of time (ca. 60 times within 2 months) was not observed. It is difficult to say anything about the possibilities of deformation over longer periods of time. The average stress σ_{av} in all bands of unannealed samples was not higher than 300 Kg/cm^2 (Fig 3). There are 2 diagrams

TITLE: Electric Slag Welding

PERIODICAL: Svarochnoye proizvodstvo, 1960, No. 12, pp. 10-14

TEXT: The development of electric slag welding, coming more and more into use, is shown in an exhibition. The Institut elektrosvarki imeni Ye.O. Patona (Institute of Electric Welding imeni Ye.O. Paton) exhibits the A-372p (A-372r) rail apparatus and the A-501M (A-501M) magnetic-pitch device, which had already been shown in Brussels and New York; and the new multi-purpose A-535 rail apparatus (Figure 2) for welding straight and circular seams of up to 500 mm thick metal with wire electrodes of 3 mm in diameter. This machine may also be converted to welding up to 800 mm thick metal, with plate electrodes up to 10 mm thickness. Three separate electrode wires are fed from a d.c motor; the welding head is equipped with a special mechanism serving to change the distance between the electrodes during welding. The nozzles are equipped with devices to correct the electrode direction during welding. The motion rate of the travelling trolley is automatically regulated, depending on the level of the welding pool. Special

Card 1/7

Electric Slag Welding

hinged slides facilitate the assembly. The machine may also be used for welding circular seams. Its technical characteristics are: 66-480 m/hour wire electrode feed rate; 0.4-9.0 m/min plate-electrode feed rate; rated current per phase - 1,000 amps; weight 380 kg. The A-569 machine (Figure 3) is intended for welding with plate electrodes and consists of a travelling trolley ensuring the controlled electrode feed, and of a support with current-fed plate holders. The current feed is performed by reliable fixed clamps instead of sliding contacts. The welding head is operated downward. The machine may be used for welding short, metal-consuming seams of not over 1.5 m length. The joint is forcibly formed by fixed, water-cooled copper plates or with the aid of steel backings. Current feed is assured by a three-phase TШС-3000-3 (TShS-3000-3) type transformer designed by the Institute of Electric Welding imeni Ye.O. Paton. The A-569 machine can also be used for welding seams of complex configuration with a "consumable nozzle" and for producing T-welds of straight joints of over 100 mm thick parts when a magnetic-pitch apparatus can not be employed. Figure 4 shows the A-645 apparatus designed by the Institute which is a convenient device for welding with a consumable nozzle. This is a portable machine fastened on a bracket which may be easily mounted on the workpiece. The wire feed to the consumable nozzle may be performed from 6 coils simultaneously. The A-671 machine is a light-weight unit with manual drive

A006/A001

Electric Slag Welding

for welding 16-40 mm thick sheet metal when assembling butt joints. The A-578 apparatus (Figure 5) is intended for electric-slag building up of grip crane cores and similar items. A rolled or forged 3X 208 (3Kh2V8) steel rod of 14-20 mm in diameter is used as a building-up electrode. Time of building up a core is 1.2-2 minutes. The device consists of a core-fastening device, a dismountable water-cooled copper mold and a mechanism for the electrode rod feed to the mold. Besides the mentioned machines, the exhibition presents various materials and articles demonstrating the efficiency of electric slag welding, as e.g. a 100-ton 20Г (20G) steel ram (welded section 2,000x3,000 mm, and weight of the welded metal: 2 tons) welded by the method of "consumable nozzle"; a 34XМ (34KhM) steel sub-press plate (600x3,500 mm section); a hydraulic press frame representing a 164-ton pipe which consists of 5 forged rings of dissimilar steel and of a 54-ton 15ГН 4М (15GN4M) steel cylinder. Electric slag welding of commercial GT -1 (VT-1) titanium is conducted on a special A-550 apparatus with sliding contacts. The considerable electrical resistivity of titanium requires an additional current feed device to be placed at a distance of 50-100 mm from the chill. A special water-cooled copper chill facilitates the assembly for welding. A single-phase TWC -3000-1 (TshS-3000-1) type transformer is used as a feed source. Welding is carried out with

Card 3/7

Electric Slag Welding

oxygen-free AH-T 2 (AN-T2) flux. An additional argon shield is developed over the pool. The technology provides for high-quality joints, and raises labor efficiency by ten times as compared to argon-arc welding. Electric slag welding is also used for the production of turbine blades; blast-furnace boiler shells; the assembly of cementation furnace bandages, the assembly on the site of spherical containers, and the production of press crankshafts, the repair of shears, fractured locomotive frames and for the production of main press girders (Figure 10).

AUTHORS: Neymark, V. Ye., Teumin, I. I., Fishkis, M. Ya.

TITLE: The effect of inoculants and insoluble impurities on the crystallization of bismuth and zinc in the field of elastic vibrations

PERIODICAL: Liteynoye proizvodstvo, no. 9, 1962, 31 - 32

TEXT: Elastic vibrations acting on metals and alloys during the crystallization process substantially improve the macro- and microstructure of ingots. The authors present various opinions found in literature on the mechanism of the vibration effect. In the tests carried out by the authors with bismuth and zinc it was found that the effect of elastic vibrations on the structure and properties of metals is more efficacious in the presence of even small amounts of impurities in the melt. Soluble and insoluble inoculants were tested, sodium being used for bismuth and magnesium for zinc. The authors give a description of the tests and the test installation, present a number of graphs showing the effect of inoculants on the bismuth grain size and the zinc grain size - amount of magnesium curve, and microsection photos. The connection between the initial and final structures of the specimens indicate that there are more insoluble impurities in the fine-grained

Card 1/2

The effect of inoculants and insoluble impurities on... S/128/62/000/009/001/003
A004/A127

than in the coarse-grained zone. With inoculant concentrations lower than the optimum value, both the vibration and soluble additives reduce σ and their additive effect promotes a decrease of the work of nucleus formation. If the inoculant concentrations are higher than the optimum, the elastic vibrations destroy the adsorbing layers on the nucleus surface, which have not yet reached the critical size, causing the crystallization centers in the melt to increase. There are 5 figures and 9 references.

TITLE: An automatic device for surveying jobs, e.g. on a river. Class 42, No. 172060

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 12, 1965, 81

TOPIC TAGS: surveying, radio transmitter

ABSTRACT: This Author's Certificate introduces an automatic device for surveying jobs, e.g. on a river. The installation contains a radio transceiver on the bank, and shipboard equipment including a radio station, a phase sensitive unit and a sonar with a tape deck. The device is designed for doing jobs at night and when visibility conditions are poor. The radio transceiver on the bank has an additional antenna. A high frequency cable is used to separate the antenna of the extra antenna from the main transmitter by a reference station. The antenna for the line of direction (of a reference hyperbola) is connected to the output of the

✓ The effect of prolonged application of manure and of mineral fertilizers on the microflora of black soils. V. N. Bylinkina and E. S. Fishkova. *Trudy Vsesoyuz. Nauch.-Issledovatel. Inst. Sel'skokhoz. Mikrobiol.* 8, 23-32 (1953).— The prolonged application of any type of fertilizer produces clear-cut pos. results with regard to the fertility of black soils through the increase in its content of total N. The enhanced formation of fertilizers affects the qual. compn. of the soil microflora. This is particularly true in the case of continuous application of manure which inevitably increases the population of manure-decomp. as well as of the N-fixing bacteria.
